

CLIENT PROJECT REQUIREMENT DOCUMENT

Synchronized Music Party Platform – Web Application

Requirements Summary & Scope

1. Purpose of This Document

This document summarizes the agreed product concept, user experience, main features, room behavior, music experience, user management, chat and moderation requirements, and the expected scope of the initial web application. Its purpose is to provide a clear understanding of what will be developed before implementation begins.

2. Project Overview

The platform will allow users to join synchronized music parties through a QR code or room link. A host creates and controls a party room, uploads the music for that session, and controls which song is being played. Participants join the active room and experience the same music session together.

The initial product will be provided as a website. The initial target is to support approximately 2,000 registered/active users across the platform. To keep the first version controlled and manageable, one host can have only one active party room at a time.

3. User Roles

3.1 Host

- A logged-in user who creates and manages a party room.
- Can create one active party room at a time.
- Can upload/select the music for the party.
- Controls the song being played for the room.
- Can control the main playback session.
- Can view participants currently in the room.
- Can manage inappropriate behavior in the live chat.

3.2 Participant

- A logged-in user who joins an active party using a QR code or room link.
- Can listen to the music selected by the host.
- Cannot change the song selected by the host.
- Cannot control the host's music or other participants' playback.
- Can control their own local listening experience, including stop/resume and playback speed.
- Can participate in the room chat while the party is active.

4. Account & Login

- Users will have an account and must log in to use the main party functionality.
- User details will be retained in the application after registration/login.
- The application will support user profiles/basic account information.
- The system will identify the host and participants separately during a party.

5. Party Room Creation

- A host can create a party room after logging in.
- A host can have only one active party room at a time.
- The host can upload the music intended for the party when creating the room.
- The room will provide a unique way to join through a QR code and room link.
- The host can start and end the party session.
- Once a party has ended, the active room and its temporary session content will no longer be available for joining.

6. Joining a Party

- Participants can enter a party by scanning the room QR code or opening the room link.
- Only an active party can be joined.
- After joining, the participant will enter the party interface and receive the current music session.
- Participants joining an already active party will be brought into the current playback position so that the listening experience remains synchronized.

7. Music & Playback Experience

The host is responsible for the music selection and the main room playback. Participants do not receive control over which song is selected for the party.

7.1 Host Controls

- Play and pause the current music.
- Change the current song.
- Move through the current song where applicable.
- Control the main playback session for all connected participants.

7.2 Participant Controls

- Participants cannot change the song.
- Participants cannot change the host's playback controls.
- They can only see current music host and chats

7.3 Music Visibility

- The participant should be able to identify the music currently playing.
- The upcoming/full host playlist should not be exposed to participants.
- Participants will not be given access to change or manage the host's uploaded music.

8. Synchronized Listening

- The host's main playback session is shared with connected participants.
- When the host starts, pauses, seeks, or changes the music, participants receive the corresponding session update.
- A participant who joins an active party should synchronize to the current song and current playback position.
- The objective is for all participants to experience the same music session together while still allowing limited personal controls such as local stop/resume and playback speed.

9. Live Party Chat

- Each active party will have a real-time chat area.
- Participants and the host can send messages while the party is active.
- Messages will identify the sending user.
- The chat is intended for communication during the party.
- Chat messages will not be retained as permanent party history after the party ends, in order to avoid unnecessary long-term storage.

9.1 Chat Moderation During the Party

- The host will be able to take action against inappropriate or vulgar messages while the party is active.
- The host may warn the relevant user.
- The host may also need the ability to restrict or remove a user from the active party when necessary.
- Only moderation-related information that is specifically required for handling a reported/flagged issue may be retained for an appropriate period.

10. Party History & Stored Information

The active party itself and temporary party content will be removed after the party ends. However, a lightweight party history/summary will remain available to the host.

- Party/session date.
- Party start time and end time.
- Total party duration.
- Number of users/participants who joined.
- Songs played during the party.
- Relevant song information needed to display the party history.

The purpose of this history is to allow the host to see basic information about previous parties without retaining large amounts of temporary party content.

11. Party Completion & Automatic Deletion

When a synchronized music party is over, the active party room will be automatically deactivated and temporary party content will be removed.

11.1 Content Removed After Party Ends

- Active room/joining session.
- Uploaded audio files associated only with the completed party.
- Temporary participant/session information that is not required for the party summary.
- Live playback/session state.
- Regular chat messages.

11.2 Information Retained

- Host/user reference.
- Party date and time.
- Party duration.
- Number of users/participants.
- Songs that were played and their relevant display information.

12. Website User Experience – Main Screens

The website should provide a simple flow centered around creating, joining, and enjoying a synchronized party.

Screen / Area	Purpose	Main Information / Actions
Login / Registration	Account access	Sign in, create account, account details
Home / Dashboard	Main starting point	Create party, join party, view relevant account/party information
Create Party	Host setup	Create room, add music, generate room access
Party Room	Main listening experience	Current song, playback, participants, QR/link, live chat
Host Controls	Manage party	Music selection, playback controls, participant/chat moderation
Participant View	Listen and participate	Current song, local playback controls, speed, chat
Party History	Review previous parties	Date, duration, participant count, songs played
Profile / Account	Manage user identity	Basic user details and account information

13. Main User Flow

Host flow:

1. User logs in.
2. User creates a party.
3. User adds the music for the party.
4. System provides a QR code and room link.
5. Host shares the QR/link with participants.
6. Participants join the active party.
7. Host controls the music session.

8. Participants listen in synchronization and use only their permitted local controls.
9. Host manages live chat and participants when necessary.
10. Host ends the party or the party reaches its completion condition.
11. Temporary party content is removed and the lightweight party summary remains available.

Participant flow:

12. User logs in.
13. User scans the QR code or opens the room link.
14. User enters the active party.
15. User receives the current synchronized music session.
16. User can stop/resume their own playback and adjust playback speed.
17. User can participate in live chat.
18. When the party ends, the participant leaves the active session.

14. Initial Scope

- Web application.
- User registration/login and account persistence.
- Host-created synchronized party rooms.
- One active party room per host.
- QR code and room-link joining.
- Host music upload for a party.
- Synchronized music playback.
- Host-controlled song selection and main playback.
- Limited participant playback controls.
- Live room chat.
- Live chat moderation by the host.
- Automatic party deactivation and removal of temporary party content.
- Lightweight party history for the host.
- Support for approximately 2,000 users as the initial target.

15. Features Not Included in This Initial Requirement Unless Later Approved

- Mobile Android/iOS applications.
- Spotify integration.
- Paid subscriptions.
- Advertising platform.
- Advanced recommendation engine.
- Advanced analytics dashboard.
- Permanent storage of complete party chat history.
- Multiple simultaneous active rooms for a single host.

16. Items Requiring Final Client Confirmation

- Maximum number of participants allowed in a single party.

- Exact conditions for when a party is considered finished/ended.
- Whether a host can manually end a party at any time.
- Allowed audio file types and maximum upload size.
- How long any moderation-related flagged information should be retained.
- Final user/profile information required at registration.
- Whether parties are public, private, or only accessible through the generated QR/link.
- Final rules concerning uploaded music ownership and user responsibility.

17. Key Product Assumptions

- The initial release is a website rather than a mobile application.
- The host is the authority for the main music session.
- Participants cannot change the song selected by the host.
- Only one active party room is allowed per host.
- Temporary party content is deleted after the party ends.
- Only a lightweight summary of completed parties is retained for the host.
- The initial target is approximately 2,000 users across the platform.

18. Client Review & Approval

This document should be reviewed and approved before development begins. Any feature, workflow, or requirement added or changed after approval may affect the project scope, timeline, and effort.
